Basic Assignment

Basic Assignment

The basic assignment will be an application in Android for managing the movies that the user watches at the cinema.

The app should storage at least the following data about each movie: Title, Director, Actors and Genre. It should also store the date when the user went to watch the movie and the place (e.g., the city). Optionally the students could add more additional data.

The text of the application (not necessarily the information about the movies) should be in at least three languages (Multilanguage): English, Finnish and another one more (student's choice).

It is possible to create multiple activities as you need. It is not mandatory to implement a permanent data storage using files or data bases, i.e., the storage could be stored in memory, which means the data are removed when the application closes.

The application should have three basic operations: adding a new movie, deleting a movie and listing all created movies. Before doing one of these operations the user has to confirm it with a Dialog Message, and also before the application closes.

This exercise could be extended with more functionality and data, it is a student's choice.

NOTE: This Basic Assignment has to be submitted to pass the course.

NOTE2: Submit to the platform a .zip file with the Android Studio or Eclipse project.
